

1
Clear span up to 20 meters

2
Roof construction with curvature

3
Insulated wall panels and thermo roof skins

The Product

The Evolution IV is the latest edition in the Neptunus Evolution temporary structure range. A sophisticated, light-weight hall that retains many characteristics of a permanent building. The maximum wall height is 3.5 metres, making it the ideal choice when heavy or high structures are unsuitable.

The Construction

The aluminium beams of the Evolution IV are designed to be lifted without the use of heavy plant and the 60mm thick horizontal wall panels are insulated to reduce climate control costs and emissions. The double skinned and air filled thermo roof adds to these insulation properties. Finished off with the Neptunus aluminium gutter system, concealed downpipes within the legs and integrated Neptunus cassette floor system the structure provides the ideal environment for any event.

Quality

Its sleek facade and internal optional linings give the Evolution IV a high quality finish. Available in clear span widths of 10, 15 or 20 metres and lengths in 5 metre modules, the Evolution IV has optional glass panels, doors and fit-out choices.

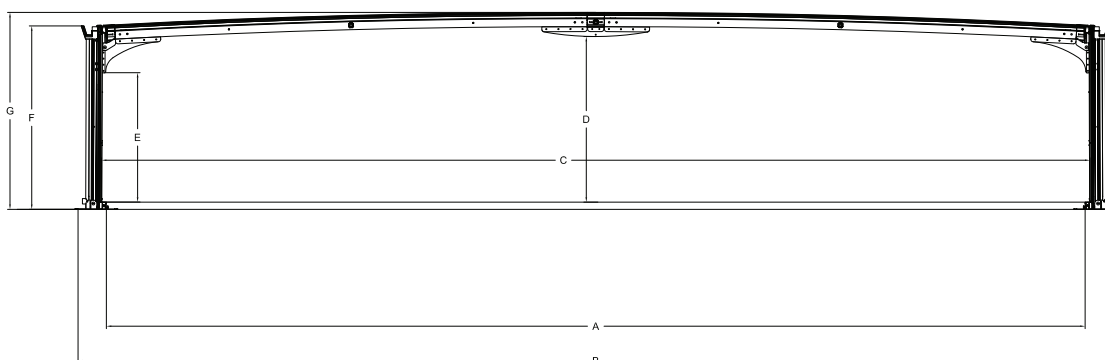

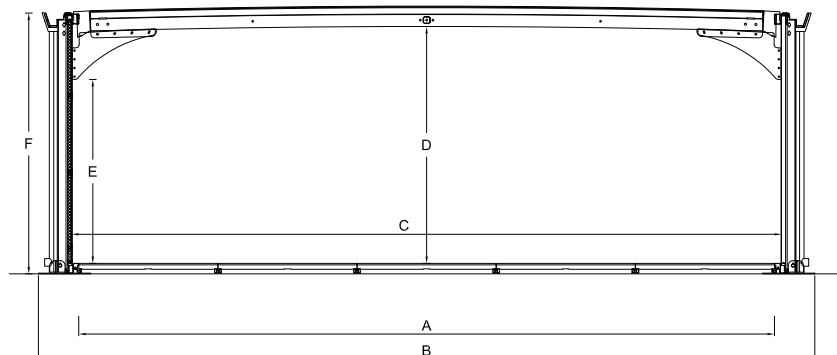

Functionality

The Evolution IV can be installed and removed quickly, so provides the ideal accommodation for any event. With its special features the Evolution IV is a great addition to our Evolution series. If you need a building higher than 3.5 meters, or with a greater span than 20 meters please refer to our other products in the Evolution range.
